                                                                                                                                           Genes were identified by a combination of three methods: Gene prediction programs including GRAIL (available by anonymous ftp from arthur.epm.ornl.gov), Genefinder (Phil Green, University of Washington), Genscan (Chris Burge, http://gromic.stanford.edu/-chris/GENSCANW.html), and NetplantGene (http://www.cbs.dtu.dk/netpgene/Cbsnetpgene.html), searches of the complete sequence against a peptide database and the Arabidopsis EST database at TiGR (http://www.tigr.org/tdb/at/at.html). Annotated genes are named to indicate the level of evidence for their annotation. Genes with similarity to other proteins are named after the database hits. Genes without significant peptide similarity but with EST similarity are named as 'unknown' proteins. Genes without protein or EST similarity, that are peredicted by more than two gene prediction programs over most of their length are predicted by tRNAscan-SE (Sean Eddy, Simple repeats are hittp://genome.wustl.eddy/tRNAscan.SE). Simple repeats are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 .>5654))

Grossman, L. I.

Location and structure of the vari gene one yeast mitochondrial

DNA: Nucleotide sequence of the 40.0 allele

Cell 30, 617-626 (1982)

83050946

Alleles of vari brossman RNA []: given sequence determines the
size of vari protein. The coding region is highly unusual: 89.6%

at with a 46 bp 'gc' residues. results strongly suggest that like
mammalian mitochondria but unlike those from Neurospora, yeast
mitochondria use 'aua' as a methionine codon. Comparison with
sequence of a vari allele specifying a larger protein suggests that
some size polymorphism of vari protein results from in-frame
insertions of a variable number of 'aat' (asn) codons. []] compares
sequence with that of the 42.0 allele of ds401.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      /db_xref="PID:9343949"

Alleles of the varl locus on yeast mitochondrial DNA specify the size of varl ribosomal RNA. [1]: given sequence determines the smallest varl protein. The coding region is highly unusual: 89.6% at with a 46 bp 'gc'-rich palindromic cluster that accounts for 38% of the total 'gc' residues results strongly suggest that like mammalian mitochondria but unlike those from Neurospora, yeast mitochondria use 'aua' as a methionine codon. Comparison with sequence of a varl allele specifying a larger protein suggests that some size polymorphism of varl protein results from in-frame insertions of a variable number of 'aat' (asn) codons. [1] compares sequence with that of the 42.0 allele of ds401.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /transl_table=3

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Fig. 1840; Protein ...

Example 3: Page 18; 28pp; English.

Example 3: Page 18; 28pp; English.

The DNA-spanner oligonucleotides BAM-36-198, BAM36-1980p, RI36-1980 and RI36-1980p, comprise a modified 5'-nucleotide followed by a crestriction site, and a long nucleotide followed by a restriction site, and a long nucleotide followed by a restriction site, and a long nucleotide followed by a crestriction site, and a long nucleotide followed by a respectively. Binding a complementary to BAM36-1980p and RI36-1980p, respectively. Binding a complementary pair of oligos to an anti-test protein antibody (Ab), which is then bound to the protein, allows the oligo sequences to form a primer template complex, which can be extended to form a double stranded duplex.

The duplex can be digested with a restriction enzyme, the prods. Separated and their band pattern detected, allowing a portion of the protein's amino acid sequence to be determined.

This method allows the determination of a protein sequence by collowed by restriction mapping. The procedure provides enough protein sequencing to allow library screening oilgo probes to be protein sequencing to allow library screening oilgo probes to be conditication events procedure allows post-translational conditication events to be characterised.

Useful as an emulsifying agent, adhesive agent or a lubricating agent. Claim 8: Figure 1F: 142pp; English.

The N-terminal region of an arabinogalactan protein (ACP) was obtd. From N. alata suspension culture. It was used as a template for the synthesis of an oligo primer which was further utilised for the isolation of a hybridising ACP gene from both N. alata and N. C. plumbaginafolia. Degenerate reverse primers corresp. to part of the ACP N-terminal AA sequence were synthesised and used to obtain a 160 bp primer extension product, which was then amplified by PCR. Additional primers, corresp. in sequence to parts of the 160-bp fragment were synthesised and used to amplify the 3' part of the Additional primers, corresp. in sequence of 22535 and 022537. A 2. C. the primer was amplified and sequenced. The alignment of the sequences obtd. from the two PCR reactions gave rise to a DNA sequences obtd. from the two PCR reactions gave rise to a DNA sequence (AF5513) by protein sequencing with two mismatches (See Q92524 FT). The 1.6 kb PCR fragment was a protein contg. The alignment of the PCR sequences with the cDNA sequence gave rise to Q92524.

The Calc. mol. wt. of the encoded protein is 51.8 kD with a processing processing protein is 51.8 kD with a processing processing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1022 CAATAACAATAATGTTTTCTCCGAGAATTACAACAACAACAATAACAACAATGCTTTCTA 1081
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 vaccines and the encoding these peptide(s) can be incorporated into virus to produce live vaccines
Disclosure; Page 21: 32pp; English.
A portion of the gene encoding the P. falciparum sporozoite antigenic protein CSP-2 (mol. wt. 42kb/54kb) was cloned. Clones 3, 4 and 6 were identified and found to contain malaria DNA inserts as represented in 012514, 012515 and 012516 respectively. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 polypeptides are present on the surface of the sporozoites and are cross-reactive with P. berghel antiserum. The Pf and Pb proteins are substantially homologous, if not identical. Sequence 144 BP; 87 A; 9 G; 0 U;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                            Example 3: Page 18; 28pp; English.

The DNA-spanner oligonucleotides BAM-36-198, BAM36-1980p, R136-198

The DNA-spanner oligonucleotides BAM-36-198, BAM36-1980p, R136-198

The DNA-spanner oligonucleotides BAM-36-198, BAM36-1980p, R136-1989 and R136-1980 and capable of annealing to a complementary sequence, at the 3'-end capable of annealing to a complementary to BAM36-1980p and R136-198 and R136-198 are complementary to BAM36-1980p and R136-1980p, respectively. Binding a complementary pair of oligos to an anti-test protein antibody (Ab), which is then bound to the protein, allows the oligo sequences to form a primer template complex, which can be extended to form a double stranded duplex. The duplex can be digested with a restriction enzyme, the prodes. The duplex can be digested with a restriction enzyme, the prodes. The protein's amino acid sequence to be determined. This method allows the determination of a protein sequence by protein sequencing to allow library screening oligo probes to be concerned by restriction mapping. The procedure provides enough protein sequencing to allow library screening oligo probes to be concerned and the corresp. cDNA clone to be PCR isolated. In addn. the epitope ordering procedure allows post-translational modification events to be characterised.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Example 3: Page 19: 28pp: English.

The DNA-spanner oligonucleotides BAM-36-198, BAM36-1980p, RI36-198

The DNA-spanner oligonucleotides BAM-36-198, BAM36-1980p, RI36-198

The DNA-spanner oligonucleotides BAM-36-1980p, RI36-1980

The Striction site, and a long nucleotide sequence contg. a sequence at the 3'-end capable of annealing to a complementary sequence, at the 3'-end capable of annealing to a complementary pair of oligos and RI36-198 and RI36-198 are complementary pair of oligos to an anti-test protein antibody (Ab), which is then bound to the protein, allows the oligo sequences to form a primer template complex, which can be extended to form a double stranded duplex.

The duplex can be digested with a restriction enzyme, the prods.

The duplex can be digested with a restriction of specific of protein sequence by epitope ordering with single, di- and tri-amined.

This method allows the determination of a protein sequence by protein sequencing to allow library screening oligo probes to be generated, and the corresp. CDNA clone to be PCR Isolated In addn.

The pitope ordering procedure DNA clone to be PCR Isolated In addn.

The pitope ordering procedure DNA clone to be PCR Isolated In addn.

The pitope ordering procedure DNA clone to be PCR Isolated In addn.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         catggatagaaacagtttcaacagtaagtacttcaaaaaacaaaagcatcatggcaagaca 68

Sequencing proteins by epitope ordering and protein restriction mapping - allows for characterisation of post-translational events
                                                                                                                                                                                                     03-0CT-1996 (first entry)

DNA-spanner oligonucleotide RI36-198.

DNA-spanner oligonucleotide, restriction site; anneal; hybridise; complementary sequence; anti-test protein antibody; extension; primer template complex; double stranded duplex; amino acid; sequence determination; epitope ordering; restriction mapping; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        03-0c7-1996 (first entry)

The DNA-spanner oligonucleotides BAM-36-198, BAM36-1980p, RI36-1988

The DNA-spanner oligonucleotides BAM-36-198, BAM36-1980p, RI36-1988 and RI36-1980p comprises a modified 5'-nucleotide followed by a restriction site, and a long nucleotide sequence contg. a sequence of the 3'-end capable of annealing to a complementary sequence, at the 3'-end capable of annealing to a complementary pair of oligos to an anti-test protein antibody (Ab), which is then bound to the Protein, allows the oligo sequences to form a primer template complex, which can be extended to form a double stranded duplex. The duplex can be digested with a restriction enzyme, the prods: separated and their band pattern detected, allowing a portion of the protein's amino acid sequence to be determined. This method allows the determination of a protein sequence by collowed by restriction mapping. The procedure provides enough protein sequencing to allow library screening oligo probes to be concerned and the corresp. CDNA clone to be PCR isolated. In addn. the epitope ordering procedure allows post-translational conditional provents to be characterised.

The epitope ordering procedure allows post-translational conditional provents to be characterised.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  9 catggatagaaacagtttcaacagtaagtacttcaaaaacaaaagcatcatggcaagaca 68
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sporozoit polypeptide antigens - are useful for antimalarial vaccines and the encoding these peptide(s) can be incorporated into virus to produce live vaccines and the base 22; 32pp; English.

A portion of the gene encoding the P. falciparum sporozoite antigento protein CSP-2 (mol. wt. 42b/54bp) was cloned. Clones 3, 4 and 6 were identified and found to contain malaria DNA inserts as represented in 012514, 012515 and 012516 respectively. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        polypeptides are present on the surface of the sporozoites and are
Sequencing proteins by epitope ordering and protein restriction mapping - allows for characterisation of post-translational events
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

Claim 2; Page 24; 63pp; English.
The DNA may be used to express Psf230 in a host cell. It can also be used in vaccines (by incorporation into viral vectors which are then used to infect host cells) and oligonucleotides derived from it can be used to identify homologous proteins in other spp.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New wheat gluten protein gene plasmid - useful for genetic transformation of yeasts to produce gliadin or glutenin Example; Fig 5; 21pp; English.

Example, Fig 5; 21pp; English.

The preferred gene fragment in the patent of the invention encodes alpha gliadin or glutenin, and the preferred plasmid encoding alphagliadin is PAY 31. The plasmid may be used for the prodn. of alphagliadin, which may be used in the food technology industry to modify prodn. processes of doughs and batters and to reduce unit costs. Gliadin may also be used for diagnosis and treatment of illness caused by wheat gluten proteins and for testing theories of dough
                                                                                                                                                                                                                                       22-MAR-1991 (first entry)
Sequence of alpha-gliadin gene fragment used to construct plasmid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  DB 1; Length 1016;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Inhibitor of tumour necrosis factor associated factor - useful to develop immunosuppressants, antiinflammatory agents and agents for treating Epstein Barr Virus associated tumours
Disclosure; Page 32-33; 43pp; English.

The present sequence encodes a novel isolated truncated murine inhibitor of tumour necrosis factor associated factor (I-TRAF) polypeptide, I-TRAF. The protein is capable of inhibiting a TRAF- mediated signalling event. A tumour associated with Epstein Barr virus (EBV) can be treated by administering an I-TRAF to a patient having developed or at Tisk of developing such tumour. The I-TRAF polypeptide, which inhibits the interaction of TRAF with members of the TRF receptor superfamily, can be used to develope immunosuppressants, antiinflammatory agents, or agents for the treatment of septic shock, inchessioned

A full-length gene (T38896) codes for carnation cv. White Sim
li-aminocyclopentane-1-carboxylic acid (ACC) synthase (W04558),
an enzyme involved in the biosynthesis of ethylene. Expression
of an internal, non-full-length fragment (T38897) of the gene
in transgenic carnation reduces the formation of ACC synthase
by co-suppression. The reduction in ACC synthase activity results
in decreased climacteric ethylene prodn. by the plant and hence
delayed senescence of flowers and buds after cutting, and increased
post-harvest life.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          08-DEC-1997 (first entry)
Truncated murine TRAF inhibitor protein I-TRAFalpha encoding cDNA.
Trumour necrosis factor receptor associated factor; TNF; tumour;
immunosuppressant; antiinflammatory; Epstein Barr virus;
septic shock; rheumatoid arthritis; Burkitt's lymphoma;
nasopharyngeal carcinoma; human; mouse; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence represents the large circular extrachromosomal element sequence of the Methanococcus jannaschii circular chromosome. The present invention describes M. jannaschii open reading frames from the genome sequence. The invention also describes a computer based system for identifying fragments of the M. jannaschii genome that are homologous to target nucleotide sequences, comprising; (a) data storage means comprising the nucleotide sequence of the 1664976, 58407 or 16550 by sequence (see V21209, V2121) and V2121), or a nucleotide sequence at least 99.9% identical to it; (b) search means for comparing a target sequence to the nucleotide sequence of the data storage means to identify a homologous sequence, and (c) retrieval means for obtaining the homologous sequence. The method, which is based on whole genome random sequencing of an autotrophic archaeon M. jannaschii, the genome
                                                                                      Disclosure: Page 6-16; 31pp; English.

The CDNA sequence encoding the carbamoyl-phosphate-transferase II
(CPSII) of Plasmodlum falciparum was determined. The cDNA encodes uprotein that includes 2 insert sequences not found in other CPSII proteins. The first separates the putative structural subdomain and the glutaminase subdomain of the glutamine-amidotransferase subunit of CPSII subunit, CPSB and CPSB. 3836 A; 774 C; 1232 G; 3078 T;

```
The present sequence represents a DNA sequence from a novel bacteriophage which has high specificity for pathogenic bacteria, c especially for strains of Escherichia coli causing enteric haemorrhage, such as E. coli 0157. The bacteriophage can be incorporated into bio-bactericidal compositions. These can contain more than one pathogen at the same time. The bio-bactericidal effect against more than one pathogen at the same time. The bio-bactericidal effect against more than one pathogen at the same time. The bio-bactericidal effect against more stability of the bacteriophage, such as glycine, arginine or lysine. The bio-bactericidal composition can be used for treating food (such as meat or fish) to prevent bacterial contamination, e.g. in fresh food or in the kitchens of restaurants, schools and other institutions. It may be formulated as a spray. It can also be used to sterilise working surfaces, aprons and other clothing. The bio-bactericides are safe to humans but very potent against pathogenic bacteria.
                                                                                                                                                                                                                                                                                                                                                                 ö

ALIGNMENTS

Whose succession of STZ and STO polypeptide(s) which confer salt tolerance - useful for producing transgenic plants or other organisms, e.g. yeast, able to grow under saline conditions or plants, yeast, able to grow under saline conditions con plants, yeast, funding and other organisms. They confer tolerance to saline conditions on plants, yeast, funding and other organisms. They can be obtained to saline conditions on plants, yeast, funding and other organisms. They can be obtained to expression of STZ (TS&R81) and STO (FYB&R82) cDNA clones that were solated from an A. thaliana library by complementation of a salt colerance phenotype in yeast. Recombinant expression of a salt con be used to express the STZ and STO polypeptides in transgenic plants, allowing the plants to grow under saline conditions. W01604; 16-APR-1997 (first entry) Arabidopsis STZ polypeptide. STZ; STO; salt tolerance; transgenic plant; yeast. Arabidopsis thaliana. T 1 W01604 standard; Protein; 227 AA.

for diagnosis, drug screening and treatment of cardiovascular disease, e.g. atherosclerosis, restenosis, hypertension, etc Example 7; Fig Ja-18; 163pp; English.

This protein is encoded by the monor characteristic subjected to This protein is encoded by the monor characteristic subjected to Ty4467) that is down-regulated in endothelial cells subjected to turbulent and laminar shear stress. Shear stress is thought to be responsible for the prevelence of atherosclerotic lesions in areas of unusual circulatory flow. The fchd31 gene product has 94% conducts were also identified for novel genes (fchd360 (see N36004), which are respectively up- and products were also identified for novel genes (fchd360 (see N36004), which are respectively up- and comm-regulated in endothelial cells subjected to shear stress. Novel fchd31, fchd360, fchd345, fchd360 and fchd460 genes (see T94467-71) provide a fingerprint for the study of cardiovascular diseases, including atherosclerosis, ischaemia/reperfusion, restenosis and arterial inflammation. Methods are provided for the diagnosis, monitoring in clinical trials, cardiovascular diseases based on discoveries regarding the
